Introduction

EPCIO-6000 adopted ITRI developed EPCIO ASIC realizing 6-axis servo positioning and synchronized control with DDA (Digital Differential Analyzer) manner delivers movement of each axis evenly. Close circuit control is in P control rule drive speed type servo drive with -10V to 10V signal, and can be applied to multi-axis precision servo control. At pulse output control, it can also read back motor encoder value via encoder input end, and allow stepping motor control. IN the control of each axis, there is a set of sensor input points, including Home points, upper stroke ultimate points and lower stroke ultimate points. Further, there is prohibit signal output point, position ready output point and emergency stop input point. As to other input/ output points, this board uses ITRI patented remote wiring saving IO design. It can be expanded maximum to 128 points input and 128 points output. Additionally, the board reserves a set of 8-channel A/D conversion .
